# Housing Prices (Portland, OR)

Price  
(in 1000s  
of dollars)

## Supervised Learning

Given the “right answer” for each example in the data.

## Regression Problem

Predict real-valued output

Classification: Discrete-valued output

# Training set of housing prices (Portland, OR)

Size in feet <sup>2</sup> (x)	Price (\$) in 1000's (y)
→ 2104	460
1416	232
→ 1534	315
852	178
...	...

$m = 47$

Notation:

- $m$  = Number of training examples
- $x$ 's = "input" variable / features
- $y$ 's = "output" variable / "target" variable

$(x, y)$  - one training example

$(x^{(i)}, y^{(i)})$  -  $i^{\text{th}}$  training example

$$\begin{aligned} x^{(1)} &= 2104 \\ x^{(2)} &= 1416 \\ y^{(1)} &= 460 \end{aligned}$$

Training Set

Learning Algorithm

Size of house  
x

h

Estimated price  
(estimated value of y)

hypothesis

h maps from x's to y's.

How do we represent  $h$  ?

$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

Shorthand:  $h(x)$

intuition I

Hypothesis:

$$\underline{h_{\theta}(x) = \theta_0 + \theta_1 x}$$

Parameters:

$$\underline{\theta_0, \theta_1}$$

Cost Function:

$$\rightarrow J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

Goal: minimize  $J(\theta_0, \theta_1)$   
 $\nearrow \theta_0, \theta_1$

Simplified

$$h_{\theta}(x) = \underline{\theta_1 x}$$

$$\theta_0 = 0$$

$$\underline{\theta_1}$$

$$J(\theta_1) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

minimize  $J(\theta_1)$   
 $\theta_1$   $\theta, x^{(i)}$

$$\rightarrow h_{\theta}(x)$$

(for fixed  $\theta_1$ , this is a function of x)

$$J(\theta_1) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

$$= \frac{1}{2m} \sum_{i=1}^m (\theta_1 x^{(i)} - y^{(i)})^2 = \frac{1}{2m} (0^2 + 0^2 + 0^2) = 0^2$$

$$\rightarrow J(\theta_1)$$

(function of the parameter  $\theta_1$ )

$$\theta_1 = 0.5?$$

$$\underline{J(1) = 0}$$

$$h_{\theta}(x)$$

(for fixed  $\theta_1$ , this is a function of  $x$ )

$$J(0.5) = \frac{1}{2m} [(0.5-1)^2 + (1-2)^2 + (1.5-3)^2]$$

$$= \frac{1}{2 \times 3} (3.5) = \frac{3.5}{6} \approx \underline{0.58}$$

$$J(\theta_1)$$

(function of the parameter  $\theta_1$ )

$$\theta_1 = 0?$$

$$J(0) = ?$$

$$h_{\theta}(x)$$

(for fixed  $\theta_1$ , this is a function of  $x$ )

$$J(0) = \frac{1}{2m} (1^2 + 2^2 + 3^2) = \frac{1}{6} \cdot 14 \approx 2.3$$

$$h(x) = -0.5x$$

$$\text{minimize } J(\theta_1)$$

$$h(x) \theta_1$$

Gradient  
descent

Have some function  $J(\theta_0, \theta_1)$   $J(\theta_0, \theta_1, \theta_2, \dots, \theta_n)$

Want  $\min_{\theta_0, \theta_1} J(\theta_0, \theta_1)$   $\min_{\theta_0, \dots, \theta_n} J(\theta_0, \dots, \theta_n)$

## Outline:

- Start with some  $\theta_0, \theta_1$  (say  $\theta_0 = 0, \theta_1 = 0$ )
- Keep changing  $\theta_0, \theta_1$  to reduce  $J(\theta_0, \theta_1)$   
until we hopefully end up at a minimum

# Gradient descent algorithm

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

learning rate

$\theta_0, \theta_1$

(for  $j = 0$  and  $j = 1$ )

Simultaneously update  $\theta_0$  and  $\theta_1$

Assignment

$$a := b$$

$$a := a + 1$$

Truth assertion

$$a = b$$

$$a = a + 1$$

Correct: Simultaneous update

$$\rightarrow \text{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$

$$\rightarrow \text{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_0 := \text{temp0}$$

$$\rightarrow \theta_1 := \text{temp1}$$

Incorrect:

$$\rightarrow \text{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_0 := \text{temp0}$$

$$\rightarrow \text{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_1 := \text{temp1}$$

Gradient descent  
intuition

# Gradient descent algorithm

repeat until convergence {

$$\rightarrow \underline{\theta_j} := \underline{\theta_j} - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

}

learning  
rate

derivative

(simultaneously update  
 $j = 0$  and  $j = 1$ )

$$\min_{\theta_1} J(\theta_1)$$

$$\theta_1 \in \mathbb{R}.$$

$$\theta_1 := \theta_1 - \underbrace{\alpha}_{\frac{\alpha}{2\theta_1}} \cdot \underbrace{\frac{\partial}{\partial \theta_1} J(\theta_1)}_{\geq 0}$$

Annotations: A red arrow points from  $\frac{\alpha}{2\theta_1}$  to the underbrace above  $\alpha$ . Another red arrow points from  $\frac{\partial}{\partial \theta_1} J(\theta_1)$  to the underbrace below it.

$$\theta_1 := \theta_1 - \underline{\alpha} \cdot (\text{positive number})$$

$$\frac{\partial}{\partial \theta_1} J(\theta_1)$$

Annotation: A red arrow points from  $\leq 0$  to the expression.

$$\theta_1 := \theta_1 - \underset{\uparrow}{\alpha} \ (\underset{\uparrow}{\text{negative number}})$$

$$\theta_1 := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_1)$$

If  $\alpha$  is too small, gradient descent can be slow.

If  $\alpha$  is too large, gradient descent can overshoot the minimum. It may fail to converge, or even diverge.

Current value of  $\theta_1$

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

Gradient descent can converge to a local minimum, even with the learning rate  $\alpha$  fixed.

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

As we approach a local minimum, gradient descent will automatically take smaller steps. So, no need to decrease  $\alpha$  over time.
